<b>Rotary Goat Feeding System</b>	ICAR-CIWA	<p>The 'Rotary Goat Feeding System' technology is a combined structure of inverted cone cage for providing green fodder and semi-circular trough for concentrated feeding mixture. This technology is women friendly and made in such a way that a woman can easily fill feed and fodder in the revolving structure for feeding the goats. It is fitted with wheels for easy transportation as per need. Women stand at a place, can feed 15-20 goats and move feeder as per need comfortably. It is an easy to operate and gender friendly system which can reduce cost of labour by 27%, feeding time by 30% and wastage of feed resources by 25-30%. It also minimizes drudgery and health hazards. As per ergonomic assessment, there is drudgery reduction of about 30% as compared to horizontal rack conventional feeding system.</p>
